V12 inherited-credit transfer

Audited result for the RSI improver-selection component

This study tested whether inherited effect estimates help a bounded improver choose edits on new tasks. Six conditions shared the same V10 source evidence, six source groups, matched development and admission opportunities, and a common 256-task final bank.

Conclusion

The declared selector screen failed. Observational-descendant and paired later-improvement credit tied immediate-only in all six source groups. Scrambled and random controls were worse. This is a validated negative component result; it does not establish recursive self-improvement.

Audit and integrity

Independent audit status: passed. It regenerated 544 tasks, reexecuted 525 unique worker batches and their exact replays, and regraded 13792 task rows with the strict host oracle. The journal contains 2274 events. The run recorded zero runtime incidents.

The audit reports post-run workspace drift in two unrelated modules and in the auditor script. The sealed source snapshot has no internal hash mismatches, and the runner's start/end integrity check passed.

Final scores

Condition	347	359	373	389	401	419	Mean
Immediate-only	60.5%	59.0%	60.2%	59.8%	59.0%	60.2%	59.8%
observational descendant	60.5%	59.0%	60.2%	59.8%	59.0%	60.2%	59.8%
paired credit	60.5%	59.0%	60.2%	59.8%	59.0%	60.2%	59.8%
scrambled paired	59.0%	59.0%	59.0%	59.0%	59.0%	59.0%	59.0%
empty	60.2%	59.0%	59.0%	59.0%	60.2%	59.0%	59.4%
random	59.0%	59.0%	58.2%	59.0%	59.0%	59.8%	59.0%

Paired mean differences versus immediate-only: observational descendant 0.00 pp; paired credit 0.00 pp; scrambled paired -0.78 pp; empty -0.39 pp; random -0.78 pp.

Compute and next decision

The run charged 2,234 worker batches, including 1,117 replay batches, 1,915,074 search expansions, 129,403,658 primitive executions, and 220,672 strict-oracle string checks.

Do not promote the current credit selector into the recursive loop. The next useful test is a calibrated estimator on larger independent source banks, or a different measured bottleneck. The DSL, edit catalog, and task generator remain bounded and researcher-authored.
